Spring Means the Appearance of Stinging Insects

As the temperature warms, we will soon see paper wasps actively constructing nests. There are two species of paper wasps, *Polistes exclamans* which is brown with yellow markings on the head, thorax and bands on the abdomen and *Polistes carolina* which is reddish-brown in color. Both have smoky colored wings and are $\frac{3}{4}$ to 1 inch in length.

In the spring, the fertile queens find a nesting site and begin to build a nest. Paper wasp nests are composed of wood fibers that are chewed and formed into open hexagonal cells arranged in a comb-like shape. The female will lay a single egg inside each nest cell. Their nests are oriented downward and are suspended by a single filament. Their nests can be found in such areas as underneath eaves, in structures, or around plants. Adult paper wasps prey on insects such as caterpillars, flies and beetle larvae, which they feed to developing larvae. This makes them a beneficial insect.

Some Control Options:

Non-Chemical Options:

Since paper wasps feed on caterpillars and other insects, they are considered beneficial insects and no control is needed. However, some people may be highly allergic to their venom, so removal of the wasps nest is necessary. Nests can be knocked down from eaves using a high pressure water spray.

Chemical Control Options:

Also pressurized sprays of insecticidal soaps and oils can be used. Residual insecticides can also be used, such as those containing the active ingredients deltamethrin or cyfluthrin.

Be sure to take precautions when treating, so the wasps will not attack nearby people or pets.
